

**AMENDMENT TO THE SPECIFICATION:**

Please amend the specification at page 8, lines 3-9 to read as follows:

Prior to removal of the garment 18 from the form 10, the exterior surface of the garment on the form 10, which will eventually be turned inside-out to form the interior surface, is preferably sprayed with adhesive 22, as shown in Fig. 1D and thereafter with cotton fibers 24 or any other suitable material as indicated in Fig. 1E, thereby to provide a comfortable and non-stick skin engaging surface. As shown in Fig. 1E, loose fibers 24 are sprayed onto garment form 10 and attach to the exterior surface of the garment 18. Preferably pad 20 is covered during the steps of Figs. 1D and 1E with a cover 26, which extends somewhat beyond the pad, so as to prevent liquid migration from ~~form~~ the pad to the cotton fibers.
